

Giving thanks for the Harvest

Bio-sand water filters reduce deforestation and help to provide clean, safe drinking water for communities across Uganda. Based on a cheap and easy-to-use technology, the filters remove 99% of pathogens and parasites from any water source without the need for chemical treatment or boiling. This year, our Harvest offering will invest in five days of water filter training for 30 people, as well as five bio-sand filters for use by the church or community members.

We're on our way to our target ...

Evans Kaddu collects water for his family from a nearby stream. As well as cleaning the water, their bio-sand filter saves time and money previously spent boiling water. The reduced charcoal use also saves the equivalent of 15 trees from being cut down.
